It sounds like a science-fiction nightmare. But “killer robots” have the likes of British scientist Stephen Hawking and Apple co-founder Steve Wozniak warning the machines could ____32____ ethnic cleansings (种族清洗) and an arms race.

Autonomous weapons, which use artificial intelligence to select targets without human intervention have been described as “the third revolution in warfare, after gunpowder and nuclear arms,” about 1,000 tech scientists wrote in an open letter on July 28, 2015.

Unlike drones, which require a human hand in their action, this kind of robot would have some autonomous decision-making abilities and the capacity to act on its own ____33____.

“The key question for humanity today is whether to start a global AI (artificial intelligence) arms race or to prevent it from starting,” they wrote. “If any major military power pushes ahead with AI weapon development, a global arms race is ____34____ inevitable,” said the letter ____35____ at the opening of the 2015 International Joint conference on Artificial intelligence in Buenos Aires.

The idea of an automated killing machine, made famous by Arnold Schwarzenegger’s Terminator, is moving ____36____ from science fiction to reality, according to the scientists. “The organization of such systems is — practically if not legally — ____37____ within years, not decades,” the letter said.

The development of such weapons, while potentially ____38____ the extent of battlefield injuries, might also lower the necessity for going to battle, noted the scientists.

The scientists painted a terrible scenario in which autonomous weapons fall into the hands of terrorists, dictators or war lords hoping to carry out ethnic cleansings.

The group concluded with a(n) ____39____ for a “ban on offensive autonomous weapons beyond meaningful human control.”

In a 2014 BBC interview, Hawking said the development of full artificial intelligence could spell the end of the human race. “It would take off on its own, and re-design itself at an ever increasing rate. Humans, who are ____40____ by slow biological evolution, couldn’t compete, and would be replaced,” he said. Authorities are gradually waking up to the risk of robot wars. Last May, the US government ____41____ a 10-year human control requirement on automated weapons. For the first time, the United Nations brought governments together to begin talks on so-called fatal autonomous weapons systems that can select targets and carry out attacks without direct human intervention.

But every year thousands become stranded, with many ____55____ to safety on board military aircraft by human. Writing in the journal Current Biology, researchers in Japan and Argentina report how they ____56____ tracking device to eight male and six female penguins in 2017 and tracked where the birds went after they left the breeding grounds of Cabo dos Bahfa in Argentina and began the migration north in April. Previously it was unknown whether male and female's took different paths or not. “Although some ____57____ are made, the exact reason for the ____58____ stranding has been unknown due to the lack of information on their behavior outside the breeding season.” said Takashi Yamamoto, a co-author of the report from the Institute of Statistical Mathematics in Japan.

The results from the study offer a clearer picture. ____59____ the authors note that only a small number of penguins were tracked, all the female's generally traveled further north. The male, meanwhile, predominantly stuck to waters of the Argentinian coast. The study also found male ____60____ dived deeper than female's: about 59 metres compared with about 35 metres.

The authors offer a number of reasons why males and females may head to different areas— including to avoid ____61____ for food—and why they dive to different ____62____ —the females' smaller bodies may restrict the depths they can reach. They also suggest the different sexes may seek waters of different temperatures, with the ____63____ females preferring warmer, shallower surroundings. While researchers are still trying to understand why penguins end up stranded, Yamamoto and colleague's suggest those that end up further north may have used more energy swimming or catching ____64____ prey, leaving them exhausted. Climate change, pollution in the area or injury from fishing equipment could also play a role. Reports of standings have noted that many penguins are unwell or exhausted, with some even washing up dead.

“____65____, plastic remains have been reported in the stomach of beach-washed Magellanic penguins,” said Yamamoto, adding that a skewed sex ratio could potentially lead to a population decline. While the findings may not help prevent strandings, Yamamoto said it could help with ____66____ of the species. “If we do not consider any action, such as marine zoning, I expect that the number of stranding individuals will increase.”

Tiny trash factories

Not all waste has to go to waste. Most of the world's 2.22 billion tons of annual trash ends up in landfills or open dump. Veena Sahajwalla, a materials scientist and engineer at the University of New South Wales, has created a solution to our massive trash problem: waste microfactories. These little trash processors house a series of machines that recycle waste and transform it into new materials with thermal technology. The new all-in-one approach could leave our current recycling processes in the dust.

Sahajwalla launched the world's first waste microfactory targeting electronic waste in 2018. A second one began recycling plastics in 2019. Now, her lab group is working with university and industry partners to commercialize their patented Microfactoric technology. She says the small scale of the machines will make it easier for them to one day operate on renewable energy, unlike most large manufacturing plants. The approach will also allow cities to recycle waste into new products on location. With a microfactory, gone are the days of needing separate facilities to collect and store materials, extract elements and produce new products.

Traditionally, recycling plants break down materials for re use c in similar products. It is like melting down plastic to make more plastic things. Her invention evolved this idea by taking materials from an old product and creating something different. "The kids don't look like the parents," she says.

For example, the microfactories can break down old smart phoned and computer monitors and extract silica and carbon, and then combine them into silicon car bide nanowires. This generates a common ceramic material with many industrial uses. Sahajwalla refers to this process as "the fourth R," adding "____ 67 ____" to the common phrase "reduce, reuse, recycle."

In 2019, just 17.4 percent of e-waste was recycled, so the new ability offers a crucial new development in the challenge recycling complex electronic devices. "We can do so much more with materials," says Sahajwala. "Traditional recycling has not worked for every recycling challenge." She and her team are already working to install the next waste microfactory in the Australian town of Cootamundra by early 2021, with the goal of expanding around the country over the next few years.

67. Which of the following is the feature of the waste microfactory?

- A. It can restore the waste to their original forms.
- B. It is cleaner than the traditional recycling plant.
- C. Waste can be recycled where they are dump at.
- D. There is only one machine in the waste microfactory.

68. According to the passage, what are the scientists working on presently?

- A. Establishing the first waste microfactory.
- B. Expanding the variety of waste it can recycle.
- C. Trying to make a profit from microfactory technology.
- D. Developing renewable energy to operate microfactories.

Shipping containers are gaining popularity as an alternative to traditional houses. These 20-or 40-foot containers can be obtained for a little as several hundred US dollars apiece, and it's not surprising that some industry professionals and even city planners consider them the future of home building. Below are details of some amazing homes made out of shipping containers.

London Container City(I and II)

London's Container City first sprang up in the heart of the docklands in 2001. It took just

five months to complete the original 12 work studios. Shortly after that, a fourth floor of studios and living apartments was built on top of these. The first container city was so successful that another — Container City II — was added to it.

Los Angeles Redondo Beach house

With its modern lines and appealing spaces the award-winning Redondo Beach House is a luxury beachside showpiece built from eight recycled steel shipping containers, along with some traditional building materials. According to the architects, the modified containers are “nearly indestructible”.

Amsterdam Keetwonen

Amsterdam’s massive Keetwonen complex houses 1,000 students and it is the largest container city in the world. The housing project is a roaring success and features units that are quiet and comfortable. Each resident enjoys a bathroom, kitchen and separate sleeping and studying quarters. The complex even has central heating and high-speed internet as well as areas for parking bikes.

Mexico M2ATK Container House

M2ATK designed this unique container house for an artist. It’s fully equipped with heating and cooling, a kitchen and bathroom. On the bottom floor of the house are “public spaces” such as the kitchen and living room. The second floor is the bedroom, and the top floor is a studio space in which to work, read and “let fly the imagination”.

71. Compared to traditional houses, container houses are ____.

- A. easier to maintain B. less expensive to build
C. more comfortable to live in D. more fashionable in style

72. What can be learned about Amsterdam’s Keetwonen complex?

- A. It is the first container city in the world. B. It’s equipped with modern facilities.
C. It features a luxury and unique style. D. It includes living space and car parks.

73. Which of the following is the best title for the poster?

Why can't we stop longing for the good old days

People in many countries are longing for the good old days. But when exactly were the good old days? Podcaster Jason Feifer devoted an episode of his program to this question. The most popular answer seemed to be the 1950s, so Mr. Feifer asked historians whether Americans in that decade thought it was particularly pleasant. Definitely not. In the 1950s, American sociologists worried that rampant individualism was tearing the family apart. There were serious racial and class tensions, and everyone lived under the nuclear threat.

In fact, many in the 1950s thought that the good old days were to be found a generation earlier, in the 1920s. But in the 1920s, child psychologist John Watson warned that because of increasing divorce rates, the American family would soon cease to exist. Many people at the time idealized the Victorian era, when families are strong and children respected their elders.

Why are human beings always so nostalgic for past eras that seemed difficult and dangerous to those who lived through them? One possibility is that we know we survived past dangers, so they seem smaller now. But we can never be certain we will solve the problems we are facing today. Radio didn't ruin the younger generation, but maybe the smart phone will.

Another reason is that historical nostalgia is often colored by personal nostalgia. When were the good old days? Was it, by chance, the incredibly short period when you happened to be young? A U.S. Poll found that people born in the 1930s and 1940s thought the 1950s was America's best decade, while those born in the 1960s and 1970s preferred the 1980s.

This kind of nostalgia has neurological roots. Researchers have found that we encode more memories during adolescence and early adulthood than any other period of our lives, and when we think about the past, this is the period we most often return to. Moreover, as we grow more distant from past events, we tend to remember them more positively.

Obviously, some things readily were better in the past. But our instinctive nostalgia for the good old days can easily deceive us, with dangerous consequences. Longing for the past and fear of the future inhibit the experiments and innovations that drive progress.

Vaccination, steam engines, railroads and electricity all met with strong resistance when they were first introduced. The point isn't to show how silly previous generations were. The same kinds of anxieties have been expressed in our own time about innovations like the internet, video games and stem-cell research.

And not all fears about the future are unbounded. New technologies do result in accidents, they disturb traditional cultures and habits, and they destroy old jobs while creating new ones. But the only way to learn how to make the best use of new technologies and reduce risks is by trial and error. The future won't be perfect, but neither were the good old days.

74. The word "rampant" in paragraph 1 is closest in meaning to _____

A. limited B. reasonable C. uncontrolled D. traditional

75. According to the passage, the 1950s was a period of time _____.

A. when American families still remained strong and children respected their elders
B. that was believed by Americans born in the 1930s and the 1940s to be the best decade
C. that saw a sharp increase in individualism and divorce rate in American society
D. when racial and class tensions became more serious but people no longer lived under the nuclear threat

76. The good old days were usually the time when people were young because _____

- ① people have a better memory of adolescence and early adulthood.
- ② More dangerous things happen during their youth and they learned how to survive them.
- ③ The dangers in youth were smaller and easier for people to deal with.
- ④ people remember events in their youth more positively as time goes by.

A. ①② B. ①③ C. ①④ D. ②④

77. What can be inferred from the last three paragraphs?

- A. The current generation is not as silly as the previous generations.
- B. It is unwise to be simply opposed to any new inventions and technologies.
- C. People are constantly deceived by their instinctive nostalgia for the good old days.
- D. The internet, video games and stem-cell research pose great threats to humanity.

How to save planet earth

Have you ever held a product in your hands and considered the existential weight of your purchase? Beyond each price tag hides a ripple effect. It expands from soil to water ways, grocery aisle to kitchen plates, factories to fulfillment centers and mail slots to landfills. This global impact has become less hidden in the past decade, and ignoring the people downstream from us has grown increasingly difficult. We're more aware than ever of the mark our consumption leaves on planet Earth, which now sustains nearly 8 billion people. Somehow, humans are still pumping more than 30 gig a tons of carbon dioxide(CO₂)per year into the atmosphere, despite the mountain of evidence that CO₂ is the top contributor to greenhouse gases causing global warming. ____78____ We know we need to do better, but we feel helpless and overwhelmed. Let's call this the eco-essential crisis; it applies on a deeply personal level for most environmentally aware humans, and on a global scale.

Climate journalist and author Tatiana Schlossberg says even a simple trip to the supermarket can feel paralyzing in 2021. "I want to buy the local thing, but it's not organic. Or, maybe it's in a plastic box," she says. In her 2019 book Inconspicuous Consumption, she ventures way beyond the store aisle and into the web of less apparent ways that humans are damaging Earth. For example, your internet use is tied to extensive carbon emissions and energy consumption. ____79____ The world is more complicated than that.

In fact, being a good citizen on planet Earth with climate concerns, you've likely asked or agonized over this question: What should I do? ____80____ So, we took this question to five people who have immersed their careers, research and writing in the realities of climate science.

One of their most consistent insights may surprise you: Consumer responsibility misses the mark. "One of the major failings of the environmental movement is having everyone focus on these small things that everyone can do." says Ayana Elizabeth Johnson-a marine biologist and co-host of the podcast How to Save a Planet. ____81____ There are just more meaningful and long-lasting ways to expend your energy in the climate fight. Most of them involve organization and collective action.

"Individuals join together to collectively have far more power changing the system than they can as individuals," says Anthony Leiserowitz, director of the Yale Program on Climate Change Communication.

A. That doesn't mean it's none of your business.

B. these experts propose other key steps that every human can take toward a better future.

C. Similar challenge apply to use of plastics and consumption of meat and other goods.

D. Part of the challenge with the environmental movement is the astonishing list of things we need to change.

E. The solution to this problem, however, is not for you to stop using the internet, according to Schlossberg.

F. It's easy to get lost in the storm of supposed answers around social media, the latest data sets and "ego-friendly" marketing campaigns.
